«Синтез комбинационных схем»

Выполнил Васильков Е. Д.

студент группы 121703

Проверил Жук А. А.

Цель: повторение и закрепление материала по синтезу комбинационных схем, освоение навыков по синтезу логических комбинационных схем, не содержащих элементов памяти.

Задание 1

Сумматор - это устройство, предназначенное для арифметического сложения двух чисел. По известному правилу сложения многоразрядных двоичных чисел каждый разряд суммы формируется из разрядов слагаемых и переноса из младшего разряда. Кроме этого, формируется перенос в старший разряд. Самый простой сумматор - это одноразрядный сумматор.

A	В	L	S	Р
0	0	0	0	0
0	0	1	1	0
0	1	0	1	0
0	1	1	0	1
1	0	0	1	0
1	0	1	0	1
1	1	0	0	1
1	1	1	1	1

Таблица истинности сумматора

В таблице истинности сумматора А и В - слагаемые, L - перенос из младшего разряда, S - сумма, P - перенос в старший разряд.

Построение СДНФ по заданной таблице

Строим две СДНФ по колонкам S и P соответственно.

```
S: (!A\&!B\&L)|(!A\&B\&!L)|(A\&!B\&!L)|(A\&B\&L) \longrightarrow не минимизируется P: (!A\&B\&L)|(A\&!B\&L)|(A\&B\&!L)|(A\&B\&L) \longrightarrow (A\&B)|(A\&L)|(B\&L)
```

Минимизация проводилась Расчетным методом

```

Синтезируем схему сумматора

На Рис. 1 представлена уже готовая схема одноразрядного двоичного сумматора на 3 входа (ОДС-3) с представлением выходных функций в СДНФ.

Рис. 1

Проведя комбинационный анализ схемы, видно, что минимизированые формулы совпадают во всех случаях.

Синтезируем схему 8-битного сумматора

Для синтеза такого сумматора, необходимо объединить 8 обычных сумматоров.

Задание 2

Разработать и проверить программу, выполняющую синтез преобразователя тетрад десятично двоичного кода Д8421 в код Д8421+n (где n=4) как устройства с не полностью определенными функциями.

Строим таблицу истинности на 4 переменные

A	В	С	D	Y1	Y2	Y3	Y 4
0	0	0	0	0	1	0	0
0	0	0	1	0	1	0	1
0	0	1	0	0	1	1	0

В данной таблице А,В,С,D - входные тетрады, а Y1, Y2, Y3, Y4 - выходные тетрады.

По заданной таблице строим 4 СДНФ по колонкам Y1, Y2, Y3, Y4 соответсвенно
